In-Class Meetings

Me, Thomas, Gabby, and Micah worked together to create a multiplayer terminal-based game collection that could run across Raspberry Pis using Python and networking features. Our goal was to make the games functional across multiple systems while keeping the program organized inside one main Python file.

April 9th-First Official Group Meeting

During our first official meeting, we discussed the overall structure of the project and the different games we wanted to include. Thomas showed us the framework and title screen he had already started working on. Gabby, Micah, and I talked about ideas for terminal games that would fit the project requirements. I decided to focus on creating the Pac-Man game while other team members worked on games such as Snake and other mini games. We also discussed using GitHub to help manage and combine our code more efficiently.

April 22-Development and Testing

At the second meeting, we started combining everyone's code into the main Pi_Party_Games.py file. Since all the games had to work under the same menu system and networking setup, we spent time adjusting and reorganizing code to make everything compatible. We tested connections between Raspberry Pis and discovered that the games connected correctly while using Wi-Fi, but ethernet connections caused issues because of network restrictions and subnetting. Even with some networking problems, most of the games were functioning correctly during testing.

April 29-Fixing the Pac-Man Issues

By this meeting, most of the project was already complete and we mainly focused on testing and improving the games. I continued working on the Pac-Man game and fixing issues related to controls and multiplayer synchronization. Some problems occurred where the game would not properly load on every Raspberry Pi system at the same time, so we spent time troubleshooting and testing different fixes. The group worked together to review gameplay, debug errors, and improve the overall performance of the project.

May 5th – Final Adjustments and Progress

During our final meeting, we focused on polishing the project and making final improvements to games like Snake and Pac-Man. We tested the multiplayer features again and confirmed that the games connected and ran more smoothly across the Raspberry Pis. We also reviewed the presentation and overall project progress together as a group. By the end of the meeting, we felt confident that the project was mostly complete and ready to be present.

Following the meeting

After our final in-class meeting, additional testing and code cleanup were completed to improve the stability of the games. Thomas reviewed parts of the networking and overall project structure while I continued making adjustments to the Pac-Man game to improve controls and gameplay performance. The team stayed in communication through GitHub and continued checking that everything worked correctly before submission.

Reflection

Working on this project gave me more experience using Python, GitHub, and Raspberry Pi systems in a group environment. One of the more difficult parts of the project was making sure all of the games worked correctly together under the same networking system and menu structure. Testing multiplayer features across multiple Raspberry Pis also took extra troubleshooting and debugging. Even though there were challenges during development, our team worked together well and helped each other solve problems throughout the project.
